

CORROSION CONTROL INTERNATIONAL

Alcoa Jetty Refurbishment Jamaica 2005-2006

“CCI is recognized worldwide as a leader in the manufacture of high quality splash zone and sub sea corrosion protection systems, including a complete range of items for the offshore oil and gas industries!”

Foam polymeric filler blocks, shaped to be a push fit between the H pile flanges, are factory sealed and co bonded to the felt gel carrier. When installed, it is designed to wrap around the outer edges of the H pile flange and close against the flange outer surface overlapping the felt from the block fitted in the opposite side. When blocks are installed, the pile takes on a rectangular shape as shown below.

Temporary work platform attached to pile to permit up-pile cleaning and attachment of upper seal collar against pile cap

Pre-formed top seals are provided to accommodate any batter angle or vertical interface with the underside of the pile cap.

CLIENT PRE QUALIFICATION TRIAL FOR SUB SEA FIELD JOINT REPAIR

Diver cleaning the underside of a sample field joint and angular face of a concrete weight coat in test tank.

Application of hydrophobic Retrogel P to pipe joint weight coat before installation of adjustable end seals.

(PQT Trial Continued)

Dual diameter Retrowrap HD field joint cover removed from test tank prior to being dismantled

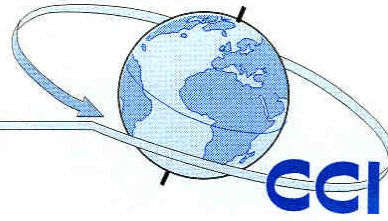

Retrowrap HD unbolted and removed from field joint showing adjustable end support collars and cohesive transfer of corrosion inhibiting gel onto pipe and concrete surface. Note no water ingress detected inside field joint assembly.
